

## RESULTS OF AGRONOMIC AND WEED SCIENCE RESEARCH CONDUCTED IN SOUTH CENTRAL MONTANA - 2007

The Annual Report of the Investigations at and Administration of the  
Southern Agricultural Research Center, Huntley, Montana

<http://www.sarc.montana.edu/annualreport/2007/>

---

<b><u>PROJECT TITLE:</u></b>	2007 Off-Station Winter Wheat Variety Performance Trials in South Central Montana. This research is partially supported by Montana Farmers through the Montana Wheat and Barley Committee.
<b><u>PROJECT LEADERS:</u></b>	Kenneth D. Kephart, Agronomist, SARC, Huntley Geraldine B. Opena, Research Associate, SARC, Huntley Phil L. Bruckner, Winter Wheat Breeder, PSPP, Bozeman James E. Berg, Winter Wheat Research Associate, PSPP, Bozeman
<b><u>PROJECT PERSONNEL:</u></b>	Tom A. Fischer, Research Specialist and Farm Foreman, SARC, Huntley Paul Dixon, Yellowstone County Extension, Billings Byron Hould, Rosebud-Treasure County Extension, Forsyth Matthew McClellan, Big Horn County Extension, Hardin Travis Standley, Stillwater County Extension, Columbus
<b><u>COOPERATORS:</u></b>	Don Holland, Farmer Cooperator, Forsyth Mike Greytak, Farmer Cooperator, Fly Creek (Hardin) Ellis Murdock, Farmer Cooperator, Lodge Grass Dave Kelsey, Farmer Cooperator, Molt Gary Broyles, Farmer Cooperator, Rapelje
<b><u>OBJECTIVES:</u></b>	To provide wheat growers in south central Montana with a reliable, unbiased, up-to-date source of information that will permit valid comparisons among improved winter wheat varieties. This information should help winter wheat producers in south central Montana select varieties best suited to their particular area and growing conditions.
<b><u>METHODS:</u></b>	<p>The 2007 off-station winter wheat trials were established under dryland conditions near Forsyth under conventional summer fallow conditions; Hardin, Lodge Grass, Molt and Rapelje under no-till, chemical fallow conditions; and under no-till, irrigated recrop conditions at Huntley (Fig. 1). Each dryland trial contained 25 winter wheat entries (21 cultivars, 4 experimental lines), and was planted using a partially balanced lattice design with three replications. The irrigated trial near Huntley contained 28 winter wheat entries (23 cultivars, 5 experimental lines) arranged in a randomized complete block design replicated three times. All entries were seeded at approximately 1 million seeds per acre under dryland conditions (~60 lb/a) and 1.5 million seeds per acre under irrigation (~90 lb/a). Actual seeding rates were calculated from the thousand kernel weight determined for the seed lot of each cultivar (Table 1), and varied from 67 to 93 pounds per acre for the dryland sites and from 100 to 140 pounds per acre under irrigation. Seeding rates were not adjusted for germination. Dryland test plots consisted of a 15-foot, 4-row plot with 14-inch row spacing. Irrigated test plots consisted of a 15-foot, 7-row plot with 7-inch row spacing. All rows of each harvested test plot were trimmed 36 inches and harvested using an experimental plot combine. Information pertaining to the traits and characteristics of the 28 winter wheat entries are provided in Table 2.</p> <p>Recorded grain yields were adjusted to 13% grain moisture content, and are reported in bushels per acre based on a 60 pound standard bushel weight. Two year (2006-07) and three year (2005-07) yield averages are provided for cultivars tested during previous years. Test weight (pounds per bushel) and grain</p>

moisture content (percent) were obtained for each plot using a Dickey-john™ GAC 2100 grain analyzer. Reported grain protein content (percent) was determined by near-infrared reflectance for each entry, and adjusted to a 12% grain moisture content. Plant height was measured in inches from the soil surface to the top of the head, excluding the awns if present. Lodging of all cultivars was noted at the irrigated Huntley and dryland Hardin locations during 2007, and recorded on a 0 to 9 scale representing no lodging to all stems lying flat on the ground, respectively. Heading was noted at Huntley when 50% of the heads in a plot had extended above the flag leaf collar. Heading dates were recorded in Julian days (number of days from January 1) for statistical purposes. Corresponding calendar dates also are presented. Information pertaining to the specific cultural management of each study site is listed at the bottom of their respective data table (Tables 3 through 8).

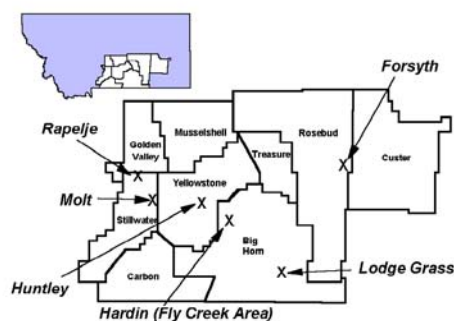

Figure 1. 2007 off-station winter wheat trial locations in south central Montana.

## **RESULTS:**

All six of the winter wheat test locations planted in the fall of 2007 received enough fall precipitation to facilitate germination and emergence. The irrigated site near Huntley was pre-irrigated in late August to saturate the soil profile before the trial was planted. Above average precipitation occurred throughout the region during October, resulting in about 6 inches of accumulated rainfall. Wet weather delayed planting of several sites, but especially affected planting at the Molt location. Short periods of extremely cold temperatures were experienced during November through early December, but temperatures were moderate for most of the winter months. Most of the test sites were dry over-winter, with very little snow accumulating. Spring rains produced average precipitation levels during most of the spring growth period. Above normal precipitation occurred during a period from late May to early June, resulting in 6 to 8 inches of rainfall at most test sites. Hot, dry weather occurred during late June and continuing through July hastened maturation of the crop, but soil moisture reserves were adequate for winter wheat to produce good yields at most sites. Overall, winter wheat yields and test weight values among the harvested trials in 2007 were above average, particularly at dryland locations, but grain protein content was much lower than average at all sites compared to these trials conducted the previous year.

Average winter wheat yield under irrigated condition in Huntley during 2007 was 104.3 bu/a (Table 3), comparable to irrigated winter wheat yield for this site the previous year. Lodging was evident in most entries, but was most severe for 'Genou', 'Rampart', 'Rocky' and 'Vanguard' winter wheat cultivars. Only the cultivar 'Garland', a Utah entry developed exclusively for production under irrigation, showed no sign of lodging under these conditions. Yields ranged from 83.2 bu/a for Rocky to 130.1 bu/a for 'Promontory'. 'BigSky' hard red winter wheat produced the heaviest test weight under irrigated conditions during 2007, averaging 63.5 lb/bu, with all 28 entries producing test weights heavier than or equal to 60 lb/bu. Grain protein averaged 12.0 percent and ranged from 10.6 to 13.8 percent. Two-year average yield for winter wheat varieties tested during

2006 and 2007 averaged 106.1 bu/a. Three-year average yield for winter wheat varieties tested during 2005 to 2007 averaged 98.2 bu/a with 'Yellowstone' winter wheat producing the highest average grain yield at 115.7 bu/a. Seven other commercial entries ('CDC Falcon', 'Hyalite', 'Jagalene', 'Norris', Promontory, 'Pryor' and 'Wahoo') have produced yields statistically equal to the yield of Yellowstone under irrigation at this site for the past three years.

Average yield under dryland conditions at Rapelje in 2007 was 73.7 bu/a (Table 4), only two bushels per acre less than winter wheat yields observed at this site in 2006. Yields ranged from 48.5 bu/a for 'Bynum' to 84.9 bu/a for Yellowstone. Thirteen additional entries including, BigSky, CDC Falcon, 'Deloris', Hyalite, Jagalene, 'Jerry', 'Morgan', Norris, 'NuSky', Promontory, Pryor, 'Tiber' and Wahoo also produced yields statistically equal with that of Yellowstone. Average test weight was 63.0 lb/bu, with all entries producing test weights heavier than 60 lb/bu. Grain protein content was low, averaging 9.1 percent and ranged from 8.2 to 11.5 percent. Three-year average yield for winter wheat varieties tested at Rapelje from 2005 through 2007 averaged 66.9 bu/a, with Yellowstone averaging 79.0 bu/a as the top yielding three-year entry. Hyalite, Jagalene, Jerry, Morgan, Norris, Promontory, Pryor and Wahoo produced yields ranging from 68.3 to 74.9 bu/a, equal to the yield produced by Yellowstone winter wheat the past three years at this location.

Average yield of the 25 winter wheat cultivars tested at Forsyth in 2007 was 41.2 bu/a (Table 5). This site received hail the previous year and was not harvested in 2006. Yields ranged from 32.4 bu/a for Hyalite to 52.3 bu/a for Wahoo. Pryor and 'Ledger' averaged 49.5 and 47.4 bu/a, respectively, which is statistically equal to the yield of Wahoo. Average test weight was 62.5 lb/bu, with all entries producing test weights heavier than 60 lb/bu. Grain protein content was low, averaging only 7.4 percent and ranged from 6.6 to 8.2 percent.

Agronomic performance of the winter wheat cultivars tested under dryland conditions near Lodge Grass during 2007 is presented in Table 6. Winter wheat grown in this region of south central Montana frequently suffers from the occurrence of dwarf bunt (*aka*, dwarf smut, TCK smut, *Tilletia controversa* Kuhn), but this disease was not evident during the 2007 season. The Lodge Grass location was established near the brow of a ridge, and did possess the coarsest textured and shallowest soils among all winter wheat test sites. Regardless, the above average precipitation received by the region resulted in an average winter wheat yield of 46.6 bu/a. Among the 25 cultivars, yields ranged from 32.1 bu/a for Yellowstone to 55.0 bu/a for Vanguard. Although Vanguard is a solid-stem type cultivar that historically performs best where wheat stem sawfly exists, wheat stem sawfly damage was not evident at this site in 2007. Average test weight was 61.2 lb/bu. Grain protein averaged only 7.0 percent and ranged from 6.0 to 8.4 percent.

Winter wheat yields under dryland conditions at the Fly Creek site near Hardin averaged 71.8 bu/a in 2007 (Table 7). Yields ranged from 61.0 bu/a for BigSky to 84.8 bu/a for Pryor. Seven other commercial cultivars (CDC Falcon, Neeley, Norris, Promontory, Rocky, Wahoo and Yellowstone) produced yields from 72.8 to 82.8 bu/a, statistically equal to the yield of Pryor. Average test weight was 60.5 lb/bu, and varied from 58.7 lb/bu for Jerry and Deloris to 63.2 lb/bu for Promontory. Winter wheat plant heights at Hardin were 3 to 5 inches taller compared to the heights observed at other dryland test sites. Lodging was evident at the Hardin site, with 17 of the 25 cultivars possessing some degree of lodging before harvest. Most of the cultivars that produced test weights lighter than 60 lb/bu were among those that experienced lodging. Grain protein levels averaged 10.9 percent among the 25 entries, with Jagalene possessing the highest protein level at 13.0 percent. Wahoo and Pryor are the highest yielding cultivars tested at Hardin the past two and three years, respectively.

Average yield under dryland conditions at Molt in 2007 was 21.8 bu/a (Table 8), or about one third of the winter wheat yield observed at Molt in 2006. The Molt location was planted late (November 8, 2006) and suffered from an infestation of cheatgrass (*aka*, downy brome, *Bromus tectorum*) which resulted in reduced and uneven winter wheat stands. Performance of the 25 winter wheat cultivars at Molt also were likely affected by the unusually hot daytime temperatures experienced during the mid-to-late grain fill period of the trial. Yields ranged from 12.3 bu/a for Norris to 31.2 bu/a for the experimental line 'MTS04120'. The highest yielding commercial cultivar in 2007 was Pryor at 28.5 bu/a. Average test weight was 60.5 lb/bu. Grain protein averaged 9.9 percent and ranged from 8.6 percent for Pryor to 10.9 percent for Bynum. Three-year average yield for winter wheat varieties tested at Molt from 2005 to 2007 averaged 43.7 bu/a, with Wahoo averaging 51.6 bu/a as the top yielding three-year entry. Genou, Neeley, Pryor, Tiber and Yellowstone produced yields from 46.1 to 50.8 bu/a, equal to the yield produced by Wahoo winter wheat the past three years at this location.

#### **SUMMARY:**

Significant differences in yield among cultivars tested in 2007 were obtained under both dryland and irrigated conditions (Tables 9, 10 and 11). Pryor produced the highest yield of 69.6 bu/a, averaged across all six of the test locations harvested in 2007, and produced the highest yield (61.2 bu/a) among entries tested at the five dryland test locations. Promontory was the highest yielding entry tested under irrigation near Huntley in 2007 (Tables 3 and 9), averaging 130.1 bu/a. The cultivar Wahoo averaged 59.9 bu/a under dryland conditions, statistically equal to the average grain yield achieved by Pryor under the same conditions. Surprisingly two of the older cultivars in the tests, 'Neeley' and Tiber, performed well at only two of the five dryland sites, but yielded well enough at the remaining sites to rank among the top yielding entries under dryland conditions.

Since 2005, experiments representing 17 location-years of testing have uniformly tested 19 cultivars at several dryland and irrigated sites in south central Montana (Table 10). Under both dryland and irrigated conditions, averaged across three years, Pryor hard red winter wheat has been the highest yielding cultivar averaging 65.7 bu/a, with only Wahoo and Yellowstone producing yields equal to those of Pryor under the same conditions. Pryor, Wahoo, Neeley and Yellowstone also have been the highest yielding cultivars tested over three years, 56.5, 56.5, 53.2 and 52.8 bu/a, respectively, when comparing only dryland environments tested in south central Montana since 2005 (Table 11).

#### **FUTURE PLANS:**

All six off-station winter wheat variety evaluations will be planted during the fall of 2007 for continuation of the program through 2008. The authors of this article wish to thank the farmer-cooperators involved who provided land and other resources for these trials, and the Montana Wheat and Barley Committee for continued financial support of this research project.

1/ Yields are based on a 60 pound standard bushel weight and adjusted to 13 percent moisture content.

2/ Grain protein values adjusted to 12 percent grain moisture content.

3/ Lodging severity scores of 0 to 9 represent no lodging to all stems flat on the ground, respectively.

\*\* Indicates highest yielding cultivar within a column. \* Indicates cultivars yielding equal to highest yielding cultivar within a column based on Fisher's protected LSD (p=0.05).

ns Indicates no significant difference between cultivars within a column based on Fisher's protected LSD (p=0.05).

#### Huntley Irrigated Winter Wheat (Exp. 073880)

Planted:	September 29, 2006	Harvested:	July 30, 2007
Fertility:	11-52-00, 100 lbs/a at planting. 46-0-0, 220 lbs/a, October 13, 2006.		
Herbicide:	Bronate Advanced, 14 oz/a + Harmony Extra, 0.33 oz/a + Olympus 0.6 oz/a + R-11, 4 oz/a, POST, April 24, 2007.		
Previous crop:	spring barley (alfalfa in 2005)		
Irrigation:	profile flooded, August 28, 2005 (preplant).		
Precipitation:	13.74 inches.

1/ Yields are based on a 60 pound standard bushel weight and adjusted to 13.0 percent moisture content.

§ Tested under irrigated conditions only in 2007.

ns Indicates no significant difference between cultivars within a column based on Fisher's protected LSD (p=0.05).

\*\* Indicates highest yielding cultivar within a column.

\* Indicates cultivars yielding equal to highest yielding cultivar within a column based on Fisher's protected LSD (p=0.05).

Table 10. Performance of 25 commercial and experimental winter wheat cultivars tested under dryland and irrigated conditions at 6 locations in south central Montana during 2007. Cultivars listed alphabetically.
